Secrets of TetraMin

20 years ago, Tetra started pioneering fish-food development

With every pack of TetraMin you are buying more than a mere product. You are also buying our research work and experience. Today, our research is intensified as it becomes more and more difficult to improve TetraMin still further, but through persistent and systematic research it has been possible to fulfill the nutritional requirements of an even greater variety of fish. Every year the number of species that can be fed exclusively on Tetra products is increased. Is systematic research work the secret of TetraMin's success?

TetraMin means longer life for your fish

Comments and Quotes

- A source of detailed information about an important group of 'new imports'

Nature's Laboratories

THERE can be little doubt about which groups of aquarium fishes make up the bulk of today's 'first-time imports' and 'new species': they are the cichlids and catfishes. These new representatives of both groups are more likely to be kept by specialist fishkeepers than by those whose aquarium interests are more general, but the specialists are assuredly a growing band whose demand has, in fact, in some instances actually stimulated the supply.

Everyone knows by now that the great lakes of Africa are proving a rich source of most interesting aquarium subjects not before readily available to aquarists. The cichlids, in particular, from these lakes have really caught the imagination of many fishkeepers. These enthusiasts must count themselves doubly fortunate in also having available a really first-class guide-book to their cichlids prepared by ichthyologists whose observations were made over long periods spent 'on the site'. This book, THE CICHLID FISHES OF THE GREAT LAKES OF AFRICA by Geoffrey Fryer and T. D. Iles (Oliver and Boyd), published last year, is in fact bound to make interesting reading for anyone with enthusiasm for living fishes, whatever the types. It will undoubtedly cause aquarists with interests in other groups to bemoan the fact that similarly satisfying detailed published information is not available for their own specialities.

Unless the Dark Continent's geography has long been an abysmal study for the reader the book will give him some eye-opening facts about these African waters as well as about their inhabitants. The Lakes

Victoria, Tanganyika and Malawi (three of about 16 major African lakes) between them contain more known fish species than any other world lake; most of these fishes are cichlids, and of these Lake Malawi has the most. It may also be a surprise to learn that there are at least 500 known cichlid species in these three lakes alone.

The interest of these lakes for the aquarist is clearly apparent, but what makes them interesting to the biologist? For the student of evolution it is because, to quote from the book's Preface, 'the great lakes of Africa are laboratories in which nature is carrying out experiments on a grand scale, and in these experiments cichlid fishes constitute the most important material'.

In their text the authors deal not only with these natural experiments but also with structure and habits of African cichlids, including their breeding, the 'language' of cichlids, their predators and parasites, their economic importance and much more. Lucky cichlid keepers to have this thoroughly scholarly work that is an example of what such a text should be, which in spite of the technicalities of some of the topics it covers is always perfectly readable.

Wrong Picture

WE regret that the photograph published with the article 'A Catfish for the Specialist' by J. Elias in last month's issue was not of the fish described in the article (*Pimelodus clarias*) but was the smaller species closely resembling it, namely *Pimelodella picta*. We are grateful to Mr D. Lambourne for drawing our attention to this error.

LETTERS

Your comments and views on all topics of interest to aquarists are welcomed. Address letters to PFM Letters, 554 Garratt, Lane London SW17 0NY

The Correct Scientific Name for Giant 'Hygro'

In your January issue you generously printed two articles on the 'giant hygro'. Dr K. Rataj called the plant *Nomaphila stricta* while Mr F. Campbell is a little worried about its name and gives *Hydrophila corymbosa* and *Hydrophila stricta* as additional names. I would like to try and explain why this confusion exists and what the correct name really is.

Plants were first given binomial Latin names around the middle of the eighteenth century. At that time relatively few plants had been collected from the tropics. When very little material was at hand there is a tendency to sort it into relatively few categories. The 'giant hygro' was first named in 1791 by the Danish botanist M. H. Vahl; he called it *Justicia stricta*. As more material from the tropics was collected and studied it was realised that *Justicia* was not a 'natural' genus and it was split up into numerous smaller genera, such as *Asteracantha*, *Hydrophila*, *Nomaphila*, *Synema* etc. In 1845 a botanist called Nees took our 'giant hygro' out of the genus *Justicia* and placed it in the genus *Nomaphila* and called it *Nomaphila stricta*.

Today we have larger collections of this group and when one compares the plants critically one finds numerous species that bridge the gaps between genera. Dr H. Heine in Paris and other botanists have studied this group and are of the opinion that the genera *Asteracantha*, *Hydrophila*, *Nomaphila* and *Synema* are not separable and they must be 'lumped' together. This work of sorting out the plants is the botanical side of the problem. To find the correct name is more or less a legal problem. The naming of plants is done by following the International Code of Botanical Nomenclature. The code contains rules governing the choice of names for plants and, among other things, it is remarkable in being truly international; botanists from all countries of the world follow the same rules. I will spare you the details but, in general, the rules of nomenclature are based on priorities, that is, the earliest legally correct name must be used.

When it is decided that *Asteracantha*, *Hydrophila*, *Nomaphila* and *Synema* are to be lumped together the correct generic name is *Hydrophila*.

Unfortunately, while our 'giant hygro' was called *Nomaphila stricta* another botanist (Lindau) described a new species of *Hydrophila* in 1894 and named it *Hydrophila stricta*. When *Nomaphila* and *Hydrophila* are combined the specific name 'stricta' is already in use in *Hydrophila* for a plant that is not our 'giant hygro'. Therefore, the next oldest name must be found and this is *Hydrophila corymbosa*. If you really think that the genera *Hydrophila* and *Nomaphila* are distinct and separate then you are entitled to call the 'giant hygro' *Nomaphila stricta*. However, if you agree that they are not separate then you must call the 'giant hygro' *Hydrophila corymbosa*. Using almost the same argument *Syneima triflorum* ('water wisteria') must be called *Hydrophila difformis*.

There are more than 100 species in the enlarged *Hydrophila* and many of them are probably suitable for aquarium cultivation. If you persist in maintaining *Syneima*, *Nomaphila* and *Hydrophila* as separate genera then you are probably going to heap more nomenclatural confusion on the next generation of aquarists because intermediate species are also likely to become available.

Satisfied Hobbyist

THREE years ago I decided to keep tropical fish. I started with two tanks 24 in. by 12 in. by 12 in. and my first fishes were guppy, sucking loach, red-fin shark. I bought books and ordered the aquatic magazines. I read the experts' advice on starting and keeping an aquarium and all the comments etc. in the monthly magazines. Some 6 months later I parted with my small tanks in favour of two more—36 in. by 15 in. by 15 in., 42 in. by 15 in. by 15 in. I then purchased more fishes and made up two good community tanks. I mixed barbs with swordtails, black mollies,

GERMAN Pumps ➤

The revitalised SP (Esha) Pumps have fast gained a reputation as the quality aquarium air pumps. The larger SP 302 SL and SP 402 SLR are encased in aluminium making these powerful pumps exceptionally quiet. Spares readily available.

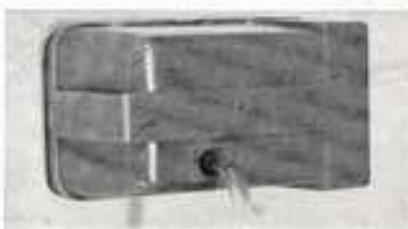

Our Managing Director, Dr Neville Carrington, visited the Orion Works in November and was highly impressed with the quality control. These excellent little pumps, running under the unfortunate name of PoPo, are first-class value.

The PoPo I for 1 or 2 outlets. Retail only £1.23 + VAT

The PoPo II for up to 4 outlets. Retail only £1.71 + VAT.

◀ *The Best of* **JAPANESE Pumps**

During the last two years, the Japanese Orion Pump Company has leapt ahead on air pump technology. This is evidenced by the very popular Orion Night and Day Pump. A very powerful twin pump suitable for several tanks or a marine set-up. With a control to cut down the power of the pump either for absolute quietness whilst watching television or when the voltage rises at night. An utterly reliable pump for only £4.10 + VAT.

DORKING SURREY

"I saw your advertisement in PFM"

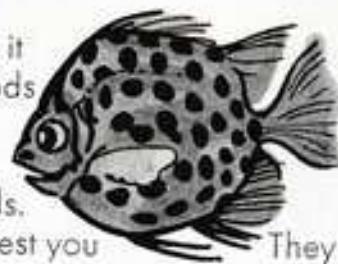

When you pay less for their food your fish will eat better.

When you work it out, Phillips Fish Foods cost about half the price of other comparable flaked foods.

Yet they're the best you can buy.

Best because of the nourishing things that go into them. Because of their high protein content. Their correct balance of vitamins and minerals.

And they cost less because

they're made right here in Britain.

So there are no import charges or big transport costs.

They also come in a range. So you can give your fish a frequent change of diet.

(They like that as much as you do.)

So, if you're not already feeding them the best, change to Phillips right away.

Phillips Fish Foods

Phillips Yeast Products Ltd.,

Please mention PFM when writing to advertisers

Flaked Fish Food

A special blend of liver, fish and meat meals, insects, crustaceans, vegetable matter, brewers' yeast, milk powder and cod-liver oil, for tropical and cold water fish. Tropical Drum 12p, 1-oz 25p, 4½-oz 58p, 18oz £1.76. Cold water Drum 11p, 1-oz 23p, 4½-oz 53p, 18oz £1.60.

Cold Water Granules

A highly nutritious scientifically formulated mixture for feeding cold water fish. In drums. 11p.

Maxiflakes

Another scientifically balanced staple food, specially designed for hand feeding large tropical and cold water fish. 1½oz 35p.

Multifreeze

A 100% freeze-dried mixture of seven nourishing foods, that retain the full nutritional value of live foods with the convenience and cleanliness of dried food. In drums. 28p.

Aquatabs

Made to press on the side of the tank so you can enjoy watching the fish feed themselves. Contain freeze-dried roe, shrimp, liver, beef heart, spinach and lettuce, cod-liver oil, milk powder, brewers' yeast and seven vitamins. They come in tubes of 24. 15p.

-the best that cost less.

Park Royal Road, London, N.W.10.

Your fish will rise to **POND PRIDE**

Fish feed on the surface from this high protein, vitamin enriched, nutritionally balanced food in large pellet form.

With POND PRIDE you can watch your fish whilst they feed, note their feeding habits and even see small fry enthusiastically nibbling their way through the floating pellets.

Standard pack contains approximately 1,000 pellets —each pellet a single well balanced meal!

Obtainable in a range of containers from 28 to 3,000 grams (Mini Standard Maxi Breeders) from pet shops and garden suppliers everywhere. In case of difficulty write to:

LETTERS

Continued from page 334

platys, zebra danio, harlequin, neon tetra, angel fish, black widows, penguins, mountain minnow, lace, pearl, three-spot gouramis, catfish, sucking loach and more red-fin sharks.

Now the reason for this letter is—I read all the comments and indeed moans of people who stick to the rules—they say they cannot breed, the water is too soft or too hard, plant life is practically nonexistent. Coventry is a hard-water area. I top my tanks by filling a bucket three-quarters full with cold tap water, bring it up to temperature with boiling water, then straight into the tanks. I clean my tanks once a month, the filter every 2 weeks. The plant life I pull out about every 3 weeks—some I give away, the rest I throw away. Plants grow so thickly that space for my fishes becomes limited. The plants are hornwort, ambulia, hygrophila, Amazon sword, hair grass and water lettuce. I have bred guppies, swordtails, black mollies, merry widows and blue acaras. I am no expert and have a great deal more to learn about these wonderful creatures. I have tried many gadgets and indeed thought of some myself to make the tanks more attractive. I feed with dried food, daphnia about every 2 months; the water is clear, the temperature 78°F and I have lost four fish in 13 months. So I have read the experts and used some of their knowledge, but I have mainly gone my own way and I believe by doing this I have had a great deal of enjoyment, with good, healthy, clean tanks. I am therefore wandering

whether this is pure luck, or have I hit an even balance?

Coventry, Warwickshire

E. ADAMS

Living Filters

REGARDING Mr J. Burtles' letter (PFM, January) about keeping mussels in tanks as 'living filters', I would like to point out that the glochidia larvae of swan mussels are parasitic on the gills of minnows in coldwater rivers and so presumably they would also parasitize tropical fish. As they greatly damage their hosts, it would seem that this is the reason why they are never seen in dealers' tanks. Also the larvae live for some time inside the parent mussel before being released into the water and so it is unadvisable even to put a single mussel in fish tanks.

Oundle, Peterborough

JAMES BYWATER

A VERY good reason for the absence of swan mussels from dealers' tanks, to which your correspondent Mr J. Burtles refers, is that in aquaria (and in my experience in small ponds, too) these molluscs do not live very long. They are wonderful 'filters' but this ingestion of particles is their way of feeding, and without a far better supply of suspended particles than the average tank or pond can provide the mussels die of starvation. I don't think much purpose would be served by keeping a tank murky with suspended food just to keep the 'filter' alive! The much smaller orb-shell and pea-shell 'cockles' (*Sphaerium* and *Pisidium*) or even the stationary mussel *Dreissena* might be much better candidates for Mr Burtles' living filter system but there may be difficulty over sensitivity to the higher water temperatures of tropical tanks.

After all, *Dreissena* is supposed to have come to this country on timber reaching us from the USSR!

Woking, Surrey

F. TURNER

Coming Events

THE BRITISH AQUARIIST STUDY SOCIETY (BASS) is holding its first meeting of the year on 31st March at the Meeting Room of the Zoological Society, Regents Park, London, NW1. Dr David Scott of St Andrews University will be talking on the Bonny Tongued Fishes of Asia and America. The lecture will be illustrated with slides and films made by the speaker on

his visits to those parts of the world. BASS is extending a special invitation to non-members for this meeting. Tickets are available from Mr F. Keen, Highcliffe, Old Hill, Woking, Surrey, price £1.00 to include refreshments.

THE Open Show organised by the Borough Council of Hackney in association with the Essex, North and East London Aquarists Association that is being held in the King's Hall, Lower Clapton Road, London, E5 on Saturday and Sunday 17th and 18th March is to comprise an

inter-club furnished aquaria class, an individual aquascaping class, an individual miniature furnished aquaria class, 23 tropical fish classes, 6 cold-water fish classes, a plants class and trade exhibits. Since the Fur, Feather and Aquaria Show held in the hall last November, improvements have been made to the heating system. Entries close on 10th March—details are available from the Ruth & Civic Recreation Department, London Borough of Hackney, 29 Lower Clapton Road, London, E5. Show secretary is Mr Ron Kerridge of Harlow.

What Fish Geneticists are Up To

ADVANCES in the field of genetics of fishes are hardly likely to make the 9 o'clock News, and to discover what is going on entails keeping a close eye on abstracts of numerous scientific journals. Even then the seeker of information is likely to feel thwarted if he finds that the original of the report that attracts his interest is in Russian or Japanese.

Geneticists concerning themselves with studies of fishes are more often than not involved with 'economic fishes', where their findings may show the way to the production of bigger, tastier or fewer-boned carp, for example, for man's consumption. Nevertheless, some of this work involves fundamental aspects of genetics that are of more general application and there are, also, some geneticists working with fish species that are found in aquarists' tanks.

A Conference on Genetics, Selection and Hybridisation of Fish was held in Leningrad in 1967 and translations from Russian of 30 of the papers presented at the Conference have just been published as a book (GENETICS, SELECTION AND HYBRIDISATION OF FISH, edited by B. I. Cherkas; I.P.S.T., Jerusalem, 1972, £9.85). Despite the long delay over publication of the papers in English their availability now is nonetheless welcome.

Apart from the carp (*Cyprinus carpio*), the fishes of interest to aquarists that have been most studied are the goldfish (*Carassius auratus*), the guppy (*Poecilia reticulata*), platys and swordtails (*Xiphophorus maculatus*, *X. variatus*, *X. helleri*), the fighting fish (*Betta splendens*), the paradise fish (*Macropodus opercularis*), the black-barred limia (*Limia nigrofasciata*) and the Japanese medaka (*Oryzias latipes*).

Inherited characteristics that have been studied are placed in four groups by Dr V. S. Kirpichnikov of the Research Institute of Lake and River Fisheries of Leningrad: 1, major structural features such as inherited variations in shape of finnage, scaling or coloration; 2, quantitative features such as variation in body weight, number of bones or fin rays; 3, physiological characteristics such as blood protein and blood 'groups'; 4, deviations from what is considered normal—deformities that can be intensified by in-breeding. Of these four groups the first and perhaps the fourth are the types of studies that involve characteristics in which aquarists are particularly interested.

For tropical fishes the main lines of research have been concerned with the way that various characters of the above-mentioned types are

inherited, the determination of sex, analysis of inheritance in varieties of a species in natural populations ('genetic polymorphism') and the genetics of malignant tumours in fish cross-breds.

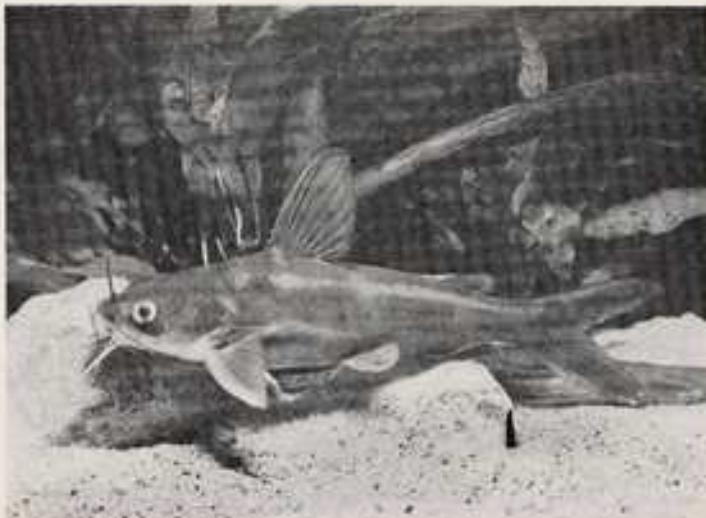

Genetic polymorphism is well known to occur in guppies and platys, showing up in their colour variations, and since colour genes in many of the livebearers are in the 'sex chromosomes' that determine sex, these two lines of investigation come together with such fishes.

V. A. Geodakyan and V. I. Kosobutski (Institute of Genetics of the Academy of Sciences of the USSR) have conducted experiments with guppies on the control of the sex ratio (relative numbers of males to females). Their findings appear to indicate that when males exceed females (10 : 1) in a breeding group the number of females produced increases. Maximum production of females under these circumstances was found by these workers to occur with the first progeny; subsequent batches of young showed a smaller bias of females over males. Likewise, although less spectacular, the result when ten females were kept with one male was that the number of males in the progeny increased. Also there was reported an overall increase in fertility of females kept with males in excess. The means by which these changes occur is unexplained, although the advantage of such an arrangement for the species can be seen.

Observations on carp have indicated that the old fish-farmer's advice not to use first-year fish or adults over 10 years old in spawning ponds is sound breeding practice, say the geneticists. Choice of breeders for goldfish selective breeding programmes might usefully be based on this observation. In a more academic vein, a discussion by R. M. Viktorovski of the possible part played by polyploidy (the development of an organism having more than the recognised species number of chromosomes per cell) in the evolution of fishes includes a note on the Cyprinidae. For species in this family other than the genera *Cyprinus* and *Carassius* the number of chromosomes is 52. In carp (*Cyprinus carpio*) it is 104 and in both Crucian carp (*Carassius carassius*) and the goldfish (*Carassius auratus*) it is 94. Has the goldfish evolved from an earlier form from which it arose by polyploidy?

At the Russian Conference decisions were taken to increase the facilities for the study of fish genetics so that the call for increased efficiency of pond culture can be met, and practical recommendations included plans for more experimental ponds and aquaria suitable for genetic research.

Asiatic Catfish Collected from a Russian River

Pseudobagrus fulvidraco

NOT long ago our permanent exhibition of fish in Brno was enriched by an acquisition donated by Herr Dr Bohumil Král of the Czechoslovak Academy of Sciences. From an expedition to the River Amur (USSR) he brought back two species of catfish, one of which was identified as *Pseudobagrus fulvidraco*.

The catfish of the Bagridae family inhabit the soft waters of Asia and Africa. About 15 genera are included in the family and two of these live in the river basin of the Amur—*Pseudobagrus* and *Leiocassis*. Representatives of *Pseudobagrus* are distributed in India, China, the basin of the Amur, Korea and Japan, and about 10 species are known. *Pseudobagrus fulvidraco* is the Asiatic catfish distributed in China, Korea and the Amur basin. The fish was first described in 1846 by Richardson under the generic name '*Pimelodus*?', but the *Pseudobagrus* genus was first created in 1863 by Bleeker. Our catfish closely resembles the Japanese species, *Pseudobagrus macrolepis* (Sauvage, 1883); but also resembles *P. intermedius* (Nehols &

By
J. ELIAS & DR. S. FRANK

Photographs by J. ELIAS

Pope, 1927) from the island Chaj-nan. Berg classifies the three species mentioned as closely related but distinct species.

In its natural waters *P. fulvidraco* grows to 14 in. (35 cm.) in length and, according to Nikolskij, the males are larger than the females. Eggs are laid in holes hollowed out of the bottom of the river bed near the bank and the male takes over the care of the brood. The fish has very fine and edible flesh.

The body is long and rounded, especially in the belly region. Across a dark, but not black, background hue, two parallel narrow grey stripes run, beginning under the dorsal and continuing to the deeply indented caudal fin. These stripes are criss-crossed by diagonal grey bars so that the

sides of the fish are marked in rectangles. The long head is flattened underneath and on top; four barbels appear on each of the upper and lower jaws. The dorsal fin is high, and the pectoral fins are broad with a tooth-shaped spike on the first hard fin-ray. The belly is white.

The fish when received were about 3 in. long (8 cm.), and they withstood the rigours of the long journey without the slightest ill-effects, remaining in extraordinarily good condition. The attention given in the few first days to new imports in an aquarium is always critical but our fish came to no harm. Within 2 weeks they were obviously feeling perfectly at home in their 22-gallon tank—the speed with which new fish settle down in a tank is in direct relation to the suitability of the conditions they are provided with. We were able to confirm that they can withstand a substantial range of water temperatures. At first they had scant respect for their surroundings but their dredging activities were only temporary; gradually these stopped completely as if the fish were somewhat ashamed of their former bad behaviour, until today they are kept in tank surroundings similar to those provided for other fishes.

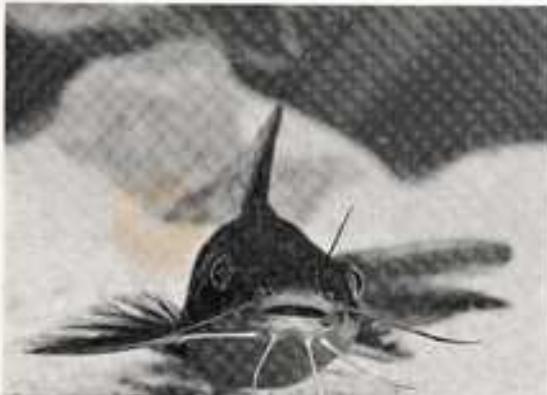

In spite of their confined quarters the fish have grown quickly and at the time of writing they are 5½ in. (14 cm.) long. It seems that they will grow even larger. Like most catfish, *P. fulvidraco* begins their day's routine in the evening. Of course, the behavioural patterns established in Nature are frequently changed or effaced in captivity and so, if a feeding time is established during the daytime, catfish will come out for food then. Indeed, if we are late our fish seem to be disturbed and scuttle around the bottom of the tank watchfully as if worried that they might have missed their rations by sleeping. During the daytime they stay in the half-light behind large stones or lie on the leaves of *Echinodorus*—they always

choose places among the plants where they will be covered by the leaf surface. When they are resting they show not the slightest movement of the fins, as if they were quite lifeless. They dash for their food with all the powerful strength of their bodies but they don't seem to overfill their small bellies in the way that *Clarias angolensis* or *Pangasius sutchi* do. *P. fulvidraco* seems to prefer smaller, regular rations of food. The basic diet we provide for these fish consists of tubifex and bloodworms. This somewhat monotonous feeding does not seem to have any detrimental effect on their general body development and it certainly seems as though we have acquired some very undemanding charges.

Again, unlike *Pangasius sutchi*, they are not too easily frightened and when moving something in their tank it is not necessary to take such precautions not to startle them as with *P. sutchi*. With the latter species we have found that even a small disturbance will lead to a frantic panic to escape, and they can do themselves great harm in the process. *P. fulvidraco* can be held in the hand and they behave largely with indifference to things going on around them. Only when real danger threatens will they take to flight. Even then, it is speedy action that is taken and not panic flight.

A temperature of between 72 and 79°F (21–26°C) seems to suit them. Only young fish are suited to the aquarium as these are likely to be more adaptable and are a more suitable and reasonable size for their surroundings. We have aimed at providing a water hardness of 8–12 DH.

Breeding in captivity under the conditions of the usual home aquarium is rarely possible with fishes like these, which are of such a large size before becoming adult. So that although the catfish has been kept in aquaria for many years and has been classified as a seldom-bred species, it is not impossible that the future will bring us a surprise.

Head-on view of the specimen of *Pseudobagrus fulvidraco* in Brno Aquarium. The high dorsal fin and broadly spread pectoral fins are demonstrated well. Undersurface of the fish is white, contrasting sharply with the dark sides and back

FISH HOUSE TECHNIQUE

Heating for the Fish House

By CLIFF HARRISON

WHETHER you plump for high-speed gas, the warmth of a living fire or half-price electricity, the problems of which to choose for the home are nothing in comparison with the decision about how to heat the fish house. Many hobbyists continue to rely on individual heaters and thermostats, such as they have used for years, but this is not necessarily the best or the most economical way. Fortunately the construction of an out-of-doors fish house from scratch means that everything can be planned and considered well in advance—the basic layout, staging, heating and tank sizes can all be designed afresh, and not be just an extension of an existing set-up.

Depending on the particular circumstances, almost any form of heating can be adapted to the fish house. Solid fuel, oil and gas are unlikely to be considered for anything smaller than a professional establishment as installation costs can be very high. If these systems are already in use in the home, however, it is possible to extend the existing hot-water circuit to include a radiator or heating-coil in the fish house. The more usual alternative heating forms to these are electricity and paraffin, both being relatively cheap to install but differing widely in running costs.

Electricity is normally used in one of two ways: for heating the tanks individually or alternatively for heating the air of the whole building. In either case there are disadvantages—with the former the large number of heaters and thermostats needed can become a major expense, quite apart from the inconvenience (and ever-present danger of electrocution) when having to disconnect them from the mains each time a tank is stripped down. The latter way—'space heating'—means that the air temperature has to be kept so high, around 80–82°F (27–28°C), as to make the fish house uncomfortable to work in for any length of time (space heating can, in any case, be done far more economically with paraffin). Further disadvantages of the use of individual heaters in aquaria are the possibility of the apparatus introducing infection to quarantined stock or causing burns or other damage to valuable specimens.

The system I have adopted overcomes these more serious problems, though it does admittedly

present a few others that I shall mention later. By using a paraffin greenhouse heater to maintain an air temperature around 72–74°F (22–23°C), and electricity to bring approximately one-half of the tanks to 80°F (27°C), I can work in comfort and yet give the fishes the temperature they require at an economical cost. People forget that many of the common livebearers (and some egg-layers, too), will live and breed quite happily in the lower seventies (°F), and the young are probably all the healthier for not being forced along at high temperatures. So these are kept in aquaria relying on the ambient heat only, whilst the individually heated tanks contain the more delicate and more demanding fishes.

The electrical heating system employs rows of insulated heating cable set in shallow open-top heating boxes about 12 in. wide; the heat output of the cable is 4 watts per foot, and six or eight rows per foot width of the box is sufficient. All-glass tanks are then placed on the boxes and, if the heating cable is connected through a thermostat on one tank, they will be kept at a particular temperature irrespective of tank length; with this system, tanks can be quickly cleaned out and rearranged according to the breeding requirements.

If the fish house is well insulated, surprising little adjustment of the output of the paraffin heater will be required—perhaps twice a week in the most changeable of weather. And for more than half the year in my fish house it is not needed at all, as the electric cable, supplemented by heat built up during the day, is able to maintain the air temperature during the occasional chilly summer or autumn night. In case the paraffin heater does fail for any reason, I have an 'emergency' system, comprising a 3-foot tubular heater and thermostat, which will cut-in if the air temperature ever falls below 68°F (20°C).

Now to the disadvantages of paraffin heating. First, paraffin heaters do have to be filled regularly and the wicks trimmed on occasions. You will also find that they produce some odorous fumes (my wife can always tell if I have spent an evening in the fish house), though rumour has it that the blue-flame types are better in this respect than the yellow-flame one I use. These fumes sometimes

produce a slight film on the aquarium water surface and on the glass, but the former disappears with the gentlest of aeration and the latter with the use of a damp paper tissue. I have never found these fumes harmful, having raised Siamese fighters and dwarf gouramis myself, and I do know that my friend, Dave Ellis, FBAS judge and lecturer, has had success with *Corydorasa* and *Hoplosternum* catfish with paraffin heating in use; all four are species one might regard as being particularly susceptible to contaminated air in the early stages of development.

By now, you will have realised that the form of heating chosen is very much a matter of personal opinion; however, I hope these notes have done something to dispel the myth that paraffin heaters will poison all your fishes. Of course, if paraffin-tainted hands are dipped into tanks, or if the wick of the heater is carelessly turned up excessively high, so that oily smoke is produced, trouble can be expected. If common sense precautions are observed, there is no reason why we should not all make use of this particularly inexpensive method of fish house heating.

COLDWATER SCENE

When is the Best Time to Purchase Stock?

asks ARPEE

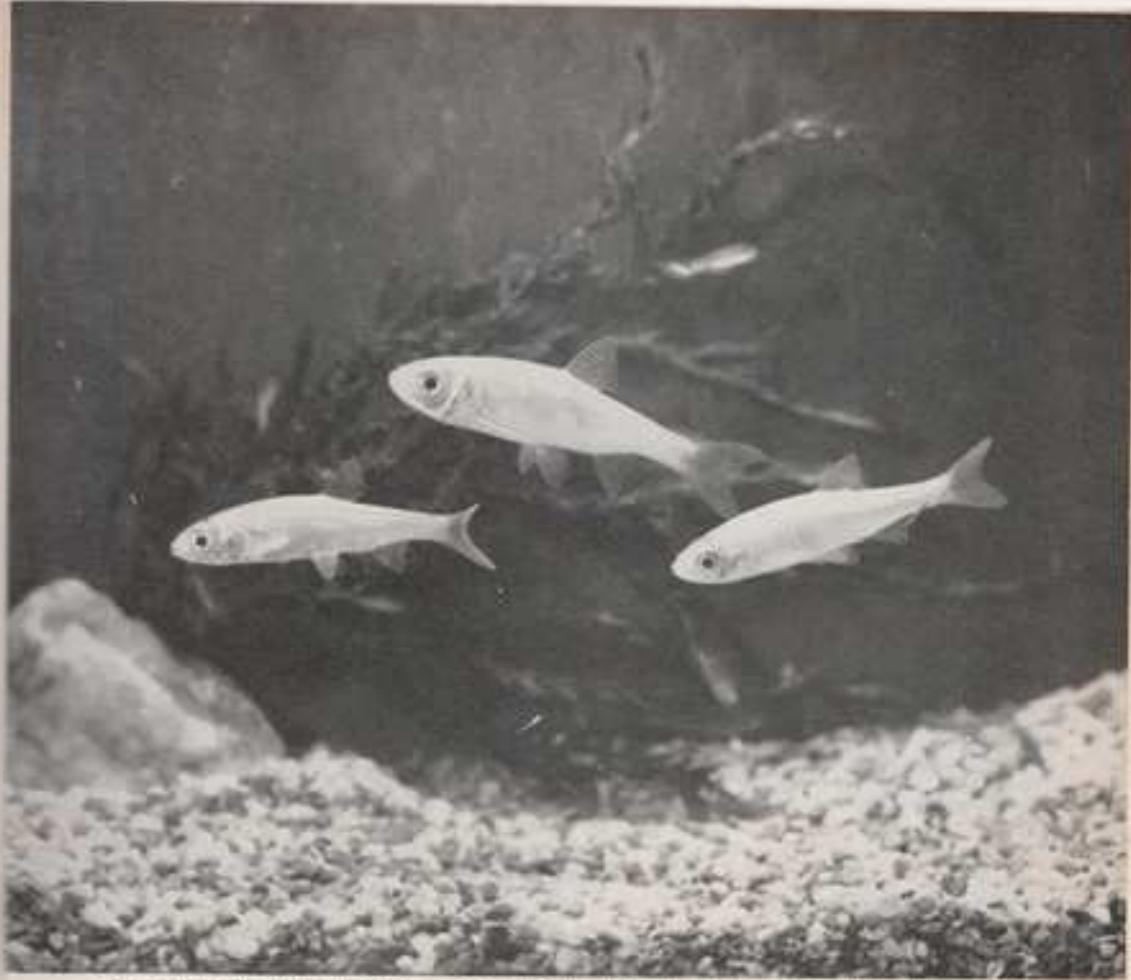

NO T so long before last Christmas I overheard a customer at a local shop asking for some small golden orfe, and he was regrettably told that none would be in stock until the spring. It is more or less taken for granted that few coldwater fishes change hands during the autumn/winter period, presumably because overwintering can be a hazardous business when a fish is exposed to strange water at a time when its resistance is taken to be at its lowest ebb. I wonder just how true this is.

I am inclined to believe that in very many cases precisely the opposite really applies, and that rather better results will be obtained from fishes bought late in the season than from those one falls for on first sighting them in April or May. I refer, of course, to imported fishes, and I believe these constitute the bulk of the market: quite different considerations would apply to home-bred specimens. Season after season I have been appalled at the wastage rate of imported coldwater fishes, and this may arise from their failure to acclimatise to our worsening summers or to a basically lower stamina. In many cases the specimens are pathetically undernourished from the outset—especially in the case of orfe—and they fall victim to disease very rapidly. Even many of nominally more robust species like shubunkins deteriorate under conditions that experienced fishkeepers would regard as being ideal for most coldwater fishes, and the answers continue to elude us.

It has been noted by a number of pondkeepers in recent summers how often golden orfe in

particular succumb to hot, thundery, weather conditions, and there has been no conclusive answer to this tendency. I have experienced this also, but it has been interesting to note that similar native fishes like roach and rudd came through unscathed. In my local conditions I have assumed that the large amounts of pondweed of different species had contributed to an overnight build-up of carbon dioxide which the sluggish weather conditions of the following day had failed to dissipate adequately for the tolerance limits of orfe. As none of the specimens was particularly robust their loss was not altogether unexpected, but I am afraid that I have the greatest reluctance now to buy imported orfe-like fish at all, though one admittedly does see the odd good importations from time to time.

The conclusion one may well draw from this is that the long and tiring journey from overseas, coupled with the curious idiosyncrasies of the climate of these isles, really sorts out the weak from the strong during the spring and summer, and that all that is worth having is what has survived in the dealer's tanks as late as the autumn. In buying then one may well assume that the fish is at least stronger than those who have fallen by the wayside, but against this is the virtual certainty that it has not been fed on a very grand scale. On balance, though, I doubt whether the fact that dried food has almost certainly been used throughout is anything to worry about. The quality of dried food has got better and better all the time and provided that the fish have been accepting it, they should be

Young healthy golden orfe readily take to garden pond life although the orfe is a fish particularly likely to be in trouble if water temperature goes up.

tolerably equipped for overwintering outdoors. Fish which are known to be late importations should, of course, be overwintered under protected conditions excepting in the very mildest parts of the country; by the second winter they should have adjusted satisfactorily.

On the basis of this reasoning I would certainly buy in spring and early summer only if I were certain that I was getting home-produced fish, and I would defer buying imported fish until at least late summer. This policy would be modified in the case of goldfish and shubunkins, which are far less worried by the climatic (thundery) conditions that take such a terrible toll of those slimmer fish which demand buoyant, highly oxygenated water. But even in these cases it does no harm

to wait until the first 'panic' buying is over, the weather has (perhaps!) improved, and the weaker ones have taken their departure. Having got your fish, regular feeding with earthworm, whiteworm and a good grade of pondfish food should make something of a foundation on which to build.

There once was a theory that coldwater fish are absolutely no trouble, but as many of them come from far warmer areas than ours we need to consider their needs more carefully than those of the neon, for example, who comes from a warm place and is automatically assigned a permanent warm place in our indoor aquaria. Use rather more than a little thought, therefore, when deciding what to do with your pond fish, and the starting point every time is where they were bred.

Is It New to You?

Five out-of-the ordinary or unidentified species included in recent tropical fish importations

Fishes owned by
DEREK LAMBOURNE

Photographs by
CLIFF HARRISON

Commonly known as the spillo shark, *Luciosoma setigerum* (above) comes from Thailand, Indo-China, Sumatra and Borneo. In the wild it grows to about 10 in. (25 cm) in length. A very lively fish that swims mostly in the upper levels of the aquarium. Most foods are eaten by this species but flies and caterpillars are preferred items of diet. At the bottom of this page is a picture of *Microglanis oter*, an attractive member of the Pimelodidae family, from Brazil. It has no common name. A fairly lively fish, growing to about 4 in. (10 cm) long.

QUITTE a few hobbyists welcome the chance to buy a 'new' fish variety or species and are happy just to be keeping something about which little is known and which is out of the usual line. Derek Lamourne is an aquarist who is particularly diligent in seeking out the odd 'unidentified' species included in importations of common species of tropical fishes, and he has obtained several interesting and unusual specimens. Derek and his wife Pat do not leave it at that, however. They make every effort to identify their new fishes positively, and with the co-operation of Dr Keith Bannister of the British Museum (Natural History) they have spent many hours searching records to try to name their fishy oddities.

Derek and Pat have even been able to provide the Museum zoologists with information to help resolve differences occurring in young and adult specimens of armoured catfishes, which until recently had caused much confusion. Derek, show secretary of Roehampton AS, has been specially fortunate in finding importers who can pinpoint the geographical origins of their shipments—important information for identification; South America is proving to be a treasure-house of species not previously seen alive in the U.K.

The catfish pictured above has not yet been conclusively identified (? *Oxydoras niger*). It has a row of spiny scales on each side. It is from South America and is a member of the Doradidae family. The probable full length is about 12 in. (30 cm)

A fish whose identity is still the subject of research is the species of *Pimelodus* shown above. It is from South America, probably Venezuela. Overall colour is grey with black spots.

The dark-loving African catfish shown in close-up below is thought to be a species of *Chrysichthys*. It is a member of the Bagridae family and comes from the Congo region. The aquarium for this fish should not be brightly illuminated; it is fully active only at night.

Four Species of Water Plants for the Connoisseur

By W. A. TOMEY

Hottonia inflata

Rotala macrandra

Bolbitis heudelotii

Schismatoglossis sp.

Photographs by the author

IN important shipments of common well-known aquarium plants, from time to time we find 'new' plants that appear to be useful for the aquarium. Often these so-called 'new kinds of aquarium plants' are very expensive, and we can never be sure that the plants will grow in our tanks and so we suffer disappointments.

On the one hand this is caused by our ignorance of the circumstances of the growth of the plants in their natural habitat and on the other hand, transport conditions and chilling during transport can affect the plants in such a way that we cannot save them from death. In addition, many 'aquatic' plants have subsequently turned out to be 'bog plants' or stream-bank plants, which do indeed grow in very moist situations, but they die if they are kept continually under water!

The percentage of really useful new plants is also very small, and I am glad to have the chance to describe four new really suitable aquarium plants. All four are beautiful in form and colour, which makes them very suitable for all tropical aquaria. Two of the plants are rapid growers, and although the other two grow less quickly they are nevertheless excellent aquarium subjects.

Hottonia inflata

In small streams around Caracas (Venezuela) a Dutch aquarium hobbyist found some time ago a small but beautiful bright-green plant, *Hottonia inflata*. This plant develops very well in the aquarium, especially with powerful lighting, but it is also important to provide a somewhat loose nutritious bottom medium, wherein the fine white roots can make their way easily. If these conditions are not satisfied, the plant will

not grow and will lose its leaves, mainly at the lower parts of its stem. Depending on the lighting, the leaves show some variability in form; the same can be observed in water wistaria (*Synema triflorum*).

When *Hottonia inflata* grows to 3-4 inches high, new branches arise, each bearing a new plant. These can serve as slips or cuttings for planting and so we are able to create a 'bed' of beautiful small foreground plants in the aquarium.

To keep these light-requiring plants low is very easy, especially if they are placed just behind the front pane of glass, so we can obtain the most beautiful colour and form effects. This is one of the best aquarium plants I ever saw!

Rotala macrandra

During a visit to India a hobbyist from Amsterdam found there a marvellous aquarium plant named *Rotala macrandra*. Until then importation of aquarium plants from India was restricted to some kinds of *Hygrophila* and *Ludwigia*, so we now have one kind more and a very beautiful one too.

Rotala macrandra was found in small lakes, creeks and deep bogs a distance of 500-600 miles south of Bombay. The plants can reach a length of 20-24 inches and they exhibit a reddish stem and soft green-rose leaves.

I suppose it must be a true water plant, because the plants are very fragile. Depending on the lighting, the leaves are more or less reddish coloured, which in combination with other aquarium plants gives a very fine effect. If fluorescent tubes are used, the leaves become a more

powerful red colour and with normal electric bulbs they become more green.

With a somewhat loose bottom medium and the proper lighting, *Rotala macrandra* grows strongly and forms new branches, which supply

Above: a fine combination—*Hemionia inflata* in the foreground with *Rotala macrandra* growing behind it.

new young plants. These plants must be handled very carefully, and they seem to grow best on a bottom of unwashed coarse river sand mixed with peat dust. Newly imported plants may require special attention. If they have not been very carefully transported, and also roughly handled, not long after they are put into the aquarium they soon start decaying.

Rotala macrandra needs a rather high temperature, 77-82°F (25-28°C) and these plants are very sensitive to temperature fluctuations, which can happen suddenly during transport, etc.

A fine and beautiful aquarium plant.

Bolbitis heudelotii

This plant originates from West Africa, where it grows wherever the circumstances are favourable. The required temperature is 72-82°F (22-28°C). No special bottom medium is required since this plant grows best on peat-wood and coarse stones. It is a typical fern, of the family Polypodiaceae, with stemmed leaves, a rhizome and roots, both somewhat hairy. In colour this beautiful fern is transparent 'bottle-green'; the leaves are very thin, through which the finely divided ribs are specially accentuated. The somewhat coarse roots and rhizomes are green, but they are covered with a kind of dark-brown 'hair'.

The well-known French ichthyologist Dr Géry was one of the first people to introduce *Bolbitis heudelotii* as an aquarium plant. Another French aquarist, Mr J. Arnoult, collected 100 plants, which he imported to Europe.

Right: with patience from the aquarist *Bolbitis* can develop into the fine plant seen in the centre. When first planted a specimen may seem not to thrive, sometimes taking 6 months before obvious growth occurs. Peat-wood is the best growing surface for it.

When first obtained the African fern *Bolbitis heudelotii* looks like this

All the plants died during aquarium cultivation, except one specimen, which was still alive after very slow adaptation. But now in Europe we find numerous descendants of that first plant!

Bolbitis heudelotii grows well in the aquarium, where it grows even in clear soft freshwater. It grows especially well in an aquarium with filtered, circulating water. Under such conditions the growth can be so rapid that in a rather small aquarium sometimes the plant becomes troublesome.

However, there is one very important condition; the plant must stay free! For example, in a crack of a piece of peat-wood or in a chink of a rock, if the rhizomes and the roots become covered over with gravel or sand the plant doesn't grow any more and the leaves become brown, until the plant dies.

Propagation of *Bolbitis heudelotii* isn't difficult and is comparable with the easy multiplication of the Java fern (*Microsorium pteropus*). Each piece of the rhizome bears one or more leaves and is able to form a new young plant. Dividing the rhizome is the right way for propagation, but this can be done only if we have full-grown plants available.

Bolbitis heudelotii is a very beautiful aquarium introduction.

Schismatoglottis species

From Malaya-Singapore a plant has been imported under the popular name silverheart, a name derived from the marvellous silver colour in the centre of the leaf around the main vein.

Schismatoglottis is really a plant from the water's edge, although it does survive under water very well. But with continuous culture under water, we observe that the plant does grow less strongly than in bog culture. I'm quite sure this beautiful plant is more suited to a vivarium or an aquascape; however, it can survive under water a long time.

In contrast to many other aquarium plants, *Schismatoglottis* is content with very moderate lighting. If these plants are used in the right places, we can obtain very decorative effects when they are planted together with other aquarium plants.

A very slow grower in the aquarium, this *Schismatoglottis* sp. from Malaya is a beautiful plant and will give its best in an aquascape

inter-club show with Lewisham AS.

MIR D. Jones of Southampton delighted members of Basingstoke & DAS with his talk on 'General Fish Care and Breeding'; the lecture by Mr P. Halliwell of Clatford revealed some very interesting facts and members appreciated the useful pamphlets on the subject that he kindly distributed. Table show class winners have been: class B, Mr A. Marshall; a.o.a., Mr J. Jackson; novice, Mr A. Marshall; danios & minnows, Mr T. Taylor; a.o.s., Mr A. Marshall; novice, Mr Amos Marshall.

HARWICH & DAS caters for tropical, coldwater and marine fishkeepers' interests and new members are always welcome. Meetings are held at Alma Inn, Harwich, the first Monday and third Tuesday of month, 8 p.m.

BECAUSE of demolition the Montrose Social Club, Liverpool is no longer the venue of the MERSEYSIDE AS. A new venue will be announced shortly.

ASK YOUR DEALER
FOR

Brosiam
SPUN-GLASS SILK

... 21 MEMBERS and two visitors attended the January meeting of STEVENAGE AS and enjoyed a talk by Mr Robinson on 'Wood and root in the aquarium'. Next meeting, Bedwell Community Centre, 8 p.m., 7th March.

MR A. Saunders won first and second places in the furnished jar class at STOCKTON AS table show (J. Mr Q. Watt). The class for a.v. labyrinth was won by Mr L. Osman (2, Mr D. Connell; 3, Mr A. Saunders) and that for large cichlids by Mr D. Connell (2,

Mr K. Hornby; 3, Mr D. Connell).

THE plaque for Fish of the Month at the January meeting of PRIVATEERS AS (Shipley, Yorks.), when a very successful auction was held, was won by Mr B. Morell of Shipley.

THE CARSHALTON & DAS is now to be known as CARSHALTON, SUTTON & MITCHAM AS. Meetings, first Monday of month, Hill House, Bishopsgate Road, Morden. (Secretary, Mr L. F. C. Loveless, 39, Brunfield Road, West Ewell, Surrey, phone 01-397-8141), and the Society will particularly welcome visits by prospective new members.

'TOP spawning' and 'bottom spawning' killifish, were the titles of lectures given to KEIGHLEY AS by Mrs S. Gear and Mr J. Mosley respectively. Ms Ibbotson won in the fish of the month (livebearers) class in the table show, Mrs Taylor the a.o.v., Mr D. Menley the N.a.o.v. and Master Hardgett the junior a.v.

Meetings and Changes of Officers

BISHOPS CLEEVE AS. Show secretary, Mrs J. Hawkins (44 Burton Street, Cheltenham, Gloucester); Show manager, Mr P. J. Greenwood (in Russell Place, Cheltenham, Gloucestershire).

BLACKPOOL & FYELD AS. New secretary, Mr R. Walker (88, Lansdown Ave., Blackpool).

BOREHAMWOOD & DAS. Chairman, Mr J. Crosslin; vice-chairman, Mr H. Farmer; treasurer, Mr R. Walbridge; secretary, Mr F. R. Long (24 Cromer House, Borehamwood, Herts, WD6 1NT); 21-03, 21-04; show secretary, Mr W. Walbridge (empty social secretary and T.R.O.), Mr D. Housard (2), Keeblethorpe Drive, Borehamwood, Herts, 01-511 3349; Meetings, 8 p.m. every second & fourth Monday, Community Centre Alton Lane, Borehamwood, Herts; everyone welcome.

BRIGHTON & SOUTHERN AS. Chairman, Mr R. Rice; secretary, Mr Bob Watson (8 Download Road, Woodingdean, Brighton, Sussex); P.R.O., Mr R. Feed (11, Worcester Road, Brighton, Sussex, BN1 3QG).

BRISTOL AS. President, Mr J. Phillips; vice-president, Mr R. Lloyd; secretary, Mr H. C. R. Thomas; treasurer, Mr V. Hoy; Mrs H. Morgan (secretary to registrar).

BRISTOL T.P.C. Meetings: third Thursday of month, the Black Horse, Old Market, Bristol.

CARSHALTON & DAS. New name: CARSHALTON, SUTTON & MITCHAM AS. Secretary, Mr L. F. C. Loveless (39, Brunfield Rd, West Ewell, Surrey, phone 01-397-8141). Meetings, first Monday of month, Hill House, Bishopsgate Road, Morden, Surrey.

Tuesday in month, Northfields Community Centre, Northfield Road, Ealing, London, W5.

EAST LONDON A & PA. President, Mr P. Campkin; vice-president, Mr Arnold; Mr Bryden; Mr Field; Mr Parsons; Mr Taylor; chairman, Mr M. Pennington; vice-chairman, Mr G. Green; secretary, Mrs P. Harris (6 Leigh Road, East Ham, London, E6); treasurer, Mr A. Harris; show secretary, Mr F. Vickery (10 Iron Works, Bow, London, E3); social secretary, Mr J. Bass; social, Mrs L. Bass; programme, Mr D. Pack; editor, Mr A. Fisher; press, Mr K. Wrightson; honorary, Mr C. Swinton; equipment, Mr G. Atmore. Meetings: from 8th Friday in month, Ripple Road School, Ripple Road, Barking, Essex.

FANCY GUPPY ASSOCIATION, BIRMINGHAM SECTION. Chairman, Mr G. Headman; vice-chairman, Mr S. G. Headman; treasurer, Mrs J. Craft; secretary, Mr G. Headman; show secretary, Mr D. Headman; Mr E. Stoddart; P.R.O., A.C. & T. Freeman (phone Bristol 7542); editor, P. & B. Walker. Meetings: fourth Sunday of month, The Glade Farm Community Centre, Streethay, Birmingham. New members welcome.

FANCY GUPPY ASSOCIATION, LANCASTER SECTION. Chairman, Mr J. Hutchinson; treasurer, Mr F. Nicholson; secretary, Mrs S. Nicholson; P.R.O., Mr J. Seddon; show secretary, Mr J. F. Peck (5 Ridge Street, Bulk, Lancaster); associate, Mr J. Macmillan.

FANCY GUPPY ASSOCIATION, MANCHESTER SECTION. Chairman, Mr R. Young; secretary, Mr Danny Gao (16 Naval Avenue, Whitefield, nr. Manchester); treasurer, Mr A. Charlton; show secretary, Mr J. Hutchinson; associate, Mr F. Campbell; P.R.O., Mr T. Holden. Meetings: second Sunday of month, 2-30 p.m., Longmead Hotel (near entrance to Selfridges, Manchester).

HARWICH & DAS. Chairman, Mr J. Baker; secretary, Mr A. Green (13 The Ridgeway, Davenport, Essex, CO12 4AU).

THE 1973 FANCY GUPPY ASSOCIATION WORLD INTERNATIONAL will be held on Sunday, 25th May, at the Globe Farm Community Centre, Stachford, Birmingham. Show schedules are available from the show secretary, Mr D. R. Beauchamp, 17 Pudmore Close, Woodmore South, Redditch, Worcs. The Show opens to the public at 3.0 p.m.

Treasurer, Mr M. Bird; Meetings: first Monday, third Tuesday of month, 8.0 p.m., Alton Inn, Harwich. Club cars for transport, coldwater, marine. New members welcome.

HENDON & DAS. Chairman, Mr H. G. J. White; vice-chairman, Mr K. L. Purbrick; secretary, Mr B. A. Maynard (see Covent Garden), London, NW1; treasurer, Mr H. C. Thompson; treasurer, Mr H. Water; show secretary, Mr B. S. Thompson (17 Highfield Avenue, London, NW1).

HENCKLEY & DAS. New venue, The Westfield Youth Centre, Rosemary Way, Henckley, Leicestershire, 7.30 p.m., third Thursday of month.

HULL AS. President, Mr R. Pool; vice-president, Mr G. Barnes; Mr T. Douglas; vice-chairman, Mr J. D. Parker; secretary, Mr J. Parker; assistant, Mrs B. Bath (16 Hazelhurst Drive, Wallington Road, Ashford, East Yorks.); show secretary, Mr G. Andrew; assistant, Mrs J. Studd; treasurer, Mrs A. Hayward; publicity officer, Mr G. Hancock; treasurer, Mr G. Bush; Meeting first and third Wednesday of month, Hull Railways and Trucks Club.

ILFORD & DAS & PS. New venue, Falcon Cross Lodge, Dartford, 7.30 p.m. (see In Brief). Secretary, Mr R. Bush, 105 Heath Rd., Chadwell Heath, Basildon, Essex.

Dates for Your Diary

Note your special dates in the PFM Aquarist's Pocket Diary 1973, now available (post free from PFM, 254 Garrett Lane, London SW1T 6NY).

3rd March. FBAS Assembly, Coopers Hall, Red Lion Square, London, WC1, 2.30 p.m.

4th March. KEIGHLEY AS Open Show, Victoria Hall, Victoria Park, Keighley Lane, Keighley, Details: Mr J. Massey, 11 Moorcroft Avenue, Oakworth, Keighley, Yorks, BD20 1NE.

10th March. RIVERSIDE AS Open Show, St Saviour Church Hall, Colindale Road, London, W12. Schedules: Mr W. Nethercott, 13 Greenwich Road, Fulham, SW6 (phone 01-586 0776).

10th-10th March. ESSEX NORTH & EAST LONDON AQUARIISTS' ASSOCIATION Open Show, Knebworth Hall, Lower Clapton Road, London, E15. Entries close 10th March. Schedules from: Bath & Civic Recreation Department, London Borough of Hackney, 28 Lower Clapton Road, London, E8.

18th March. DON VALLEY AS 1st Open Show, British Steel Corporation Staff Dining Room, Stockbridge, nr. Sheffield. Schedules: Mr G. A. Hoyland, 35 Haggisford Road, Oughtibridge, Sheffield.

KIDDERMINSTER & DAS. Chairman, Mr B. McKenna; secretary, Mr P. R. Allen; treasurer, Mr G. Dunn; show secretary, Mr W. Nixon.

LEEDS AS. President, Mr H. Tordoff; chairman, Mr D. W. Ellis; vice-chairman, Mr D. King; secretary, Mrs J. Howe (10, 31 Mount Rd., New Malden, Surrey); treasurer, Mr R. Ledwith; show secretary, Mr D. Mackay; assistant, Mr J. Pollock; P.R.O., Mr E. Farley. Meetings: on & 3rd Thursday of month, St Luke's C of E Primary School, Elm Rd., Kingstone upon Thames, Surrey.

LEEDS AS. President, Mr G. Lissens; vice-president, Mr K. Raynor; treasurer, Mr J. Boustead; secretary, Mrs H. J. Merrill (25 Garfield Drive, Wharfedale, Leeds, LS2, Yorks.); Meetings: second Wednesday of month, The Anglers Club, Barnsley Road, Leeds 9.

MERSEYSIDE AS. New secretary, Mr B. Wilson (4 Thorpe, Skelmersdale, Lancs, WN8 8QQ); phone Skelmersdale 84125.

MIXENDEN TFS. Chairman, Mr R. Edwards; treasurer, Mr G. Poole; secretary, Mr S. Lovell (74, Crook Lane, Mixenden, Halifax, Yorks); P.R.O., Mr R. Turner.

NEWBURY & DAS. Chairman, Mr G. Smith; vice-chairman, Mr K. Lloyd; secretary, Mr G. Taylor (2 York Close, Newbury, Berks.); treasurer, Mr R. N. Lloyd; show manager, Mr P. Legg; show secretary, Mr G. Foster.

PONT TALBOT & DAS. Show secretary, Mr A. E. B. Farmer (c/o, Cross St., Velindre, Port Talbot, Glamorgan, SA13 1AZ).

RUGBY FC. New secretary, Mr P. Sharpen (222 Freemason Road, Rugby, Warwicks.).

RUNNymeDE AS. Chairman, Mr K. Smith; vice-chairman, Mr J. Garrard; treasurer, Mr T. Butler; assistant, Mrs T. Butler; secretary, Mr P. Cairns (1, Lancaster Road, Ashford, Middlesex); phone 020 486 1262.

secretary, assistant, Mr J. Shepherd; show secretary, Mr M. Moore; assistant, Mrs J. Garrard.

SALISBURY & DAS. Chairman, Mr T. Minter; chairman, Mr D. Adam; show secretary, Mr G. Lewis (18 St. Peters Rd., Salisbury, Wilts.); secretary, Mr P. G. Grant (16 Paragon Grove, West Harnham, Salisbury, Wilts.).

SCARBOROUGH & DAS. Change of venue. Second & fourth Thursday of month, The Delvers Social Club, New Queen Street, Scarborough.

Fish that flourish get
GUSSIE Fish Food Flakes
Now they get

Armitages

It's Armitages quality that you've been buying all along, under the brand name of Gussie. Now we've decided to come right out and call our fish food flakes by the name found on so many fish pet products — Armitages. Don't worry, the fish flakes are still the same balanced formulae of protein, fat and raw fibres your fish thrive on, and the same clear food that never clouds the water or blackens the gravel. And we haven't fiddled with the sizes.

There are still standard, large and 10 oz. drums for Cold Water Fish Food Flakes and standard, large breeder size and 10 oz. for Tropical Fish. But there is one big difference you'll notice as soon as you pick up a new supply of Armitages. The drums are now plastic. Watertight. Molden-proof. Lightweight. We couldn't make our product any better so we found a better way to package it.

Budding aquarists can still get 'GUSSIE' Food, Ant Eggs and Daphnia for their goldfish.

ARMITAGE BROS. LTD., ARMITAGE HOUSE, COLWICK, NOTTINGHAM NG4 2BA. Telephone: (0602) 243023

OUR AIM IS TO SATISFY

A PRACTICAL FISHKEEPING MANUAL

KOI

Keeping the Fancy
Japanese Pond Carp

By COLIN D. ROE
& ANTHONY EVANS

This PRACTICAL FISHKEEPING MANUAL from PetFish Publications was the first comprehensive book in English on the fancy Nishiki-koi from Japan. Colour photographs show a wide range of the available koi varieties; information on the origin of these, as well as practical advice on keeping and breeding koi.

The House of Fishes

ANY MORE FOR THE VAT RACE?

Next month all of the items that go to make our hobby (save magazines and books) will be subject to a new tax. The tax is expected to be about 10%, although in the rest of the 'Market' fishkeeping is currently taxed at 16%!

Sufficient to say that considerable saving will be effected by buying this month—stealing a March before April—as it were.

Another way to save hard-earned cash—we have in stock the following 'Malawi' cichlids, bred in the locality:

| | | | | | |
|------------------|-----|-----|-------------------|-----|-----|
| Mel. vermiculus | 1½" | 50p | Ps. auratus | 2½" | 75p |
| Lab. trewavassei | 1" | 50p | Ps. macropthalmus | 2" | 50p |
| Lab. fuilleborni | 2½" | 75p | | | |

—and for the specialist a couple of fairly rare gems:

| | | |
|--------------------------------------|----|--------|
| Julidochromis ornatus | 2" | £2.50 |
| Melanochromis labrosus (rubber lips) | 4" | £7 ea. |

UNIQUE BIOLOGICAL
 UNDER-GRAVEL **FILTER**
 FOR TROPICAL AND MARINE OR COLD WATER AQUARIA
Fit it—Forget it!

REGD. DESIGN
 No. 15464

Nothing but water can get beneath the flush fitting base once it has been installed and no further attention is necessary.

OBtainable from your usual supplier now! (Or direct—add 15p p. & p.)

These three sizes, used singly or in multiples will fit the standard range of aquaria.

Manufactured in England by **ALGARDE** 401a Ripple Road, Barking, Essex

This filter, which will operate from a standard air pump, was designed especially to meet the exacting demands of the modern aquarist.

The design of the base and the large bore air-lift (which can be fitted either end) give the high rate of filtration necessary even for marines.
